Measurement & Analysis service

scentif.ai®

Introduction to Measurement＆Analysis service

If you are considering the introduction of a smell sensor, we offer contract testing services using the 5C-SSM to help you confirm in advance whether your target samples will trigger a response from the sensor. We will test the samples you provide and deliver the results to you.

※ Please note that additional fees may apply for samples with strong odors or high hazard levels, or those requiring pretreatment such as heating. Please consult with us in advance.

Service overview

Process

Sending Samples to the Numazu Office

We will confirm detail of the samples in advance. Please contact us regarding the sample contents and number of specimens.

Sample measurement (Option: Analysis)

Measurements will be performed using the 5C-SSM (total 15 membrane). Analysis is available as an option.

Delivery of measurement data

We will email the complete set of measurement data to the person in charge.

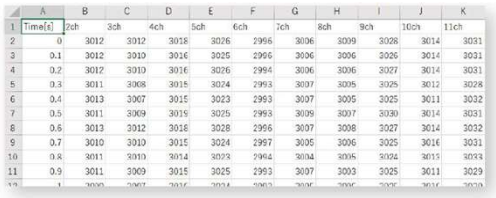

Sample measurement

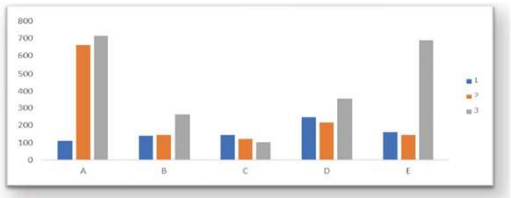

We will analyze your samples and provide you with raw data in CSV format and bar charts.

Deliverables：

CSV data

Bar graph data

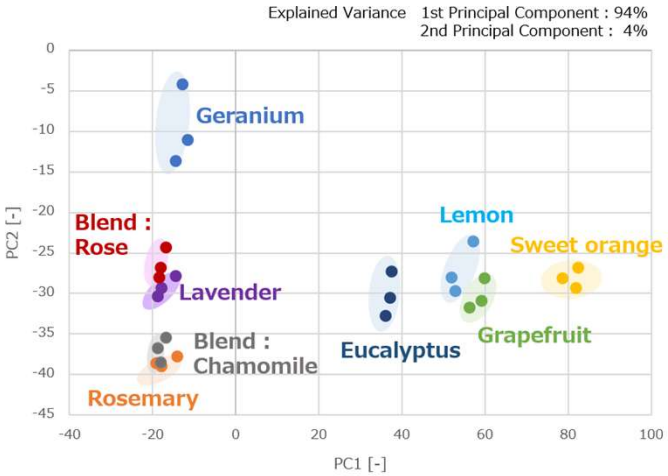

Principal component analysis（PCA）

This is a statistical analysis method that summarizes data containing a large number of numerical values and extracts the overall characteristics of the data in a lower-dimensional space. By summarizing the data along two axes that best represent its overall characteristics, it becomes easier to understand the differences and relationships between data points.

*Analysis will be performed using data obtained from sample measurements.

Deliverables:

・PCA report
